API

Connect aSa.Studio
to third-party software

aSa® | Design. Fabricate. Build.

About
APIs

An API – Application Programming Interface – is a connector. APIs provide separate systems with a way to safely and efficiently talk to each other.

aSa.Studio APIs allow you to send and retrieve data from any third-party system that has its own open API. This means if you use an accounting, ERP, or CRM system that has an API (and many do!), you can share your aSa rebar data with that system, and vice versa.

aSa.Studio
Safely share data with other software packages.

API
Shared technology that allows systems to connect.

Third-Party
Send data to, and receive data from, aSa.Studio.

Helping you
work smarter

Why connect using APIs?

- The format used by all APIs is universal and easy for other applications to understand and consume, even when the underlying business logic is complicated.

- APIs are secure. API schemas serve as contracts, establishing what data API publishers will share. APIs protect data structures, business logic, and IP outside of those agreements by limiting user access.

Clear documentation

- Your development team or third-party consultants will have no trouble connecting to aSa data.

- We provide a comprehensive list of every connection point to and from aSa.Studio.

Two-way communication

- Our API has Get and Create calls, which means the communication between aSa.Studio and your third-party software is two way.

Comprehensive connections

- aSa provides thousands of connection points from every module in our system.

- Share a wealth of information related to:
    - customers
    - projects
    - estimates
    - orders
    - loads
    - shipping tickets
    - inventory receipts
    - inventory tags
    - inventory transactions
    - available inventory
    - processing tags
    - heat information
    - invoices
    - customer payments
    - so much more!

Experience
these key benefits

Eliminate duplicate data entry
Changes in one system automatically update the other, so you don't have to type the same information twice.

Reduce errors
When you only enter information once, you remove the opportunity for typos and inconsistencies.

Maximize your investment
If you rely on an ERP, accounting, CRM, or other third-party system, connect aSa.Studio to that system via APIs. No need to purchase a new product or retrain employees.

Streamline your operation
API-driven changes to your data act as effective triggers for your software system or your personnel to take the "next step" in your company's workflow.

Get the big picture
Better reporting. Combine data from your various software products to get a more comprehensive view of your business.

Automate processes
Tasks such as updating spreadsheets or copying values from one system to another are tedious and error prone. Integration replaces manual tasks with smooth continuous communication between systems.

aSa APIs allow you to securely share data from thousands of aSa.Studio fields with other applications. You can pull information from aSa's database to send to third-party systems. You can also push data from your third-party packages to aSa. For example, update inventory in an ERP system based on aSa.Studio stock rebar receipts, or create a customer in aSa.Studio based on activity in your CRM system.
